

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

Liberty Utilities' Water System Has Levels of Perfluorooctanesulfonic Acid (PFOS) and Perfluorooctanoic Acid (PFOA) Above the Response Level

Per and poly fluoroalkyl substances (PFAS) are a group of man-made chemicals resistant to heat, water, and oil that are used in many industrial and consumer applications. Two of the more common PFAS are perfluorooctanesulfonic acid (PFOS) and perfluorooctanoic acid (PFOA). Manufacturing of PFAS started in the 1950s, and a majority of the chemicals are still used today in products such as carpets, rugs, waterproof clothing, upholstery, food paper wrappings, non-stick products, cleaning products, fire-fighting foams, and metal plating (e.g. cookware). As a result, PFAS can be found in the air, water, and soil as well as everyday products.

As a result of the routine monitoring of our water system for drinking water contaminants, we placed several wells on standby status in the mid-2020s due to PFAS. With the recent adoption of a maximum contaminant level for PFAS and PFOA and a compliance date of 2029, we are changing the standby status on these wells to active status to utilize less expensive water supply sources.

The average concentration of PFOS and PFOA in these wells is above the public health-based response levels. Although this is not an emergency, you have a right to know this, what you should do, and what we are doing about this situation.

The State Water Board has established a notification level of 6.5 nanograms per liter (ng/L) and response level of 40 ng/L for PFOS. PFOS may cause immune suppression and cancer in the body. The average level of PFOS over the last year listed below is based on results of annual average monitoring and is above the response level.

Well Name	Quarterly Running Average (ng/L)
Well 28B	56
Well 41A	41
Well 46C	49

The State Water Board has established a notification level of 5.1 ng/L and response level of 10 ng/L for PFOA. PFOA may cause increased liver weight and cancer in the body. The average level of PFOA over the last year listed below is based on results of annual average monitoring and is above the response level.

Well Name	Quarterly Running Average (ng/L)
Well 28B	14
Well 41A	16
Well 46C	16

What should you do?

- You do not need to use an alternative water supply (e.g., bottled water).
- This is not an emergency or an immediate risk. If it had been, you would have been notified immediately.
- This is not considered a high concentration exposure and therefore is not associated with immediate health concerns. However, *some people who drink water containing PFOS or PFOA in excess of the notification level over many years may experience adverse health effects. PFOS exposures have been shown to cause immune suppression and cancer in laboratory animals. PFOA exposures have been shown to cause increased liver weight and cancer in laboratory animals.*
- If you have other health issues concerning the consumption of this water, you may wish to consult your doctor.

What is being done?

Routine regulatory sampling of Liberty's well water supply yielded levels of PFOS and/or PFOA that were above the public health-based response levels. Liberty is diligently working to address this. Liberty has met with a water treatment service provider and has preliminary designs for an ion exchange treatment system to reduce the levels of PFAS/PFOA. This type of system is easy to maintain and operate and will not have a large visual impact to properties adjoining the various sites.

For more information, please contact the Customer Care Center at 800-727-5987, visit us at 9750 Washburn Rd. Downey, CA 90241 or utilize our website at: www.libertyutilities.com.

Please share this information with people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this public notice in a public place or distributing copies by hand or mail.
