

2021 CONSUMER
CONFIDENCE REPORT ON
WATER QUALITY FOR 2020

ANNUAL WATER QUALITY REPORT

Lynwood / Rancho Dominguez

Liberty is committed to providing customers with safe, quality drinking water. We are proud to present this Water Quality Report (Consumer Confidence Report) that shares detailed information regarding local water service and our compliance with state and federal quality standards during the 2020 calendar year.

Liberty makes appropriate investments each year to deliver water that meets safety standards established by the State Water Resources Control Board's Division of Drinking Water (DDW), California Public Utilities Commission (CPUC), and the United States Environmental Protection Agency (EPA). We invest responsibly to maintain the local water infrastructure because a strong infrastructure is key to delivering quality water. The water we deliver to your home or business is thoroughly tested by independent laboratories, and data is provided to DDW to verify compliance with primary and secondary state and federal water quality standards.

We know our customers rely on us for water that is safe to drink, and we take this responsibility seriously. At Liberty, "Energy and Water for Life" are more than a tagline. Our employees live in the community and take pride in providing quality water and reliable service to you and your neighbors.

If you have any questions about this report, please don't hesitate to contact us at 800-727-5987.

On behalf of the entire Liberty family, thank you for being a valued customer and neighbor. We are proud to be your water provider.

Sincerely,

Chris Alario
President, Liberty - California

This report contains important information about your drinking water. Please contact Liberty at (800) 727-5987 for assistance in Spanish.

Este informe contiene información muy importante sobre su agua para beber. Favor comunicarse con Liberty al (800) 727-5987 para asistirlo en Español.

Where Does My Water Come From?

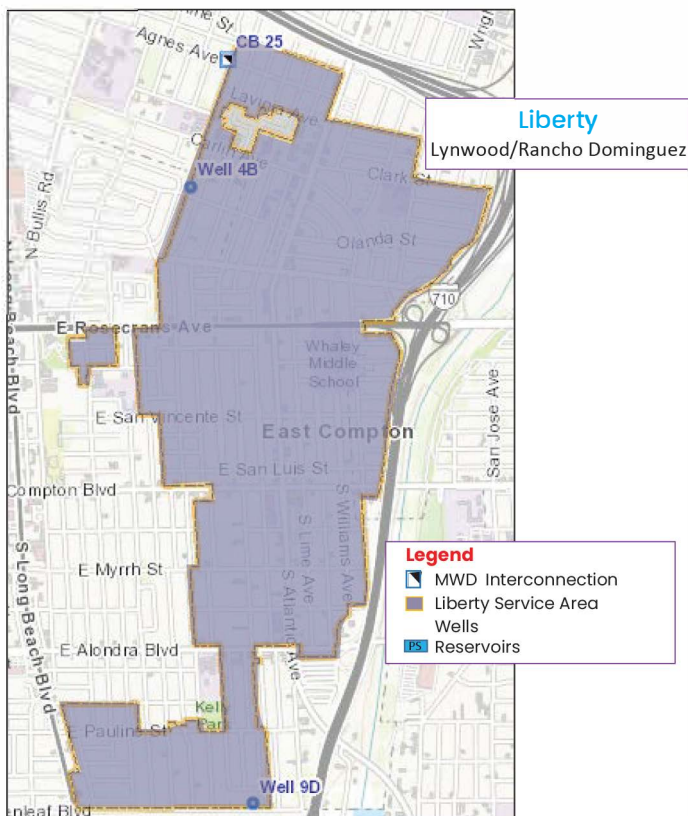

In 2020 Liberty Utilities – Lynwood/Rancho Dominguez system obtained 0.9% of its source water from the Metropolitan Water District of Southern California (MWD). The MWD imports water from the Colorado River Aqueduct and from the Sacramento-San Joaquin Delta by way of the State Water Project. An additional 99.1% came from Wells 9D and 4B that pump groundwater from the Central Basin Aquifer

About the Metropolitan Water District of Southern California

MWD is a consortium of 26 cities and water districts that provides drinking water to nearly 19 million people in parts of Los Angeles, Orange, San Diego, Riverside, San Bernardino, and Ventura counties. The mission of the MWD is to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. MWD continues to add storage and conservation resources to its already diverse water supply portfolio to ensure a reliable water supply well into the future. Further, MWD continues to invest in water quality improvements, including the addition of ozone as a treatment process, and the expansion of its treatment capacity that will provide excellent quality water. For more information about MWD, visit their website at www.mwdh2o.com.

Two Sources of Imported Water

The Lynwood/Rancho Dominguez system receives the majority of its water from the MWD Diemer Filtration Plant in Yorba Linda. In 2020, the Diemer Plant source water consisted of 9% State Water Project supply, and 91% Colorado River Water supply.

From The United States Environmental Protection Agency (USEPA)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants that can be naturally-occurring or be the result of oil and gas production or mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the State Water Resources Control Board (SWRCB) prescribe regulations that limit the number of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration and California Law also establish limits for contaminants in bottled water that provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline at 1-800-426-4791.

Sensitive Populations May Be More Vulnerable

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The USEPA and Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

What Are The Drinking Water Standards?

Drinking water standards are the regulations set by the USEPA to control the level of contamination in the nation's drinking water. The USEPA and the SWRCB are the agencies responsible for establishing drinking water quality standards in California. These standards are part of the Safe Drinking Water Act's "multiple barrier approach" to drinking water protection. This approach includes assessing and protecting drinking water sources; protecting wells and surface water; making sure water is treated by qualified operators; ensuring the integrity of the distribution system, and making information about water quality available to the public. The water delivered to your home meets the standards required by the USEPA and the SWRCB.

If you would like more information about water quality, or to find out about upcoming opportunities to participate in public meetings, please call Liberty's Downey office at (800)-727-5987.

This report describes those contaminants that have been detected in the analyses of almost 200 different potential contaminants, nearly 100 of which are regulated by the USEPA and the SWRCB. Liberty is proud to tell you that there have been no contaminants detected that exceed any federal or state drinking water standards. Hundreds of samples are collected every month by Liberty to assure that all primary (health related) and secondary (aesthetic) drinking water standards are being met. Sample results are available on the table that is part of this report.

This report is intended to provide information for all water users. If received by an absentee landlord, a business, or a school, please share the information with tenants, employees, or students. We are happy to make additional copies of this report available. You may also access this report on the Liberty web page at www.libertyutilities.com.

Source Water Assessment

The 1996 Safe Drinking Water Act amendments required states to perform an assessment of potentially contaminating activities near drinking water sources of all water utilities. Liberty updated the Source Water Assessment in 2017. Liberty's well sources are considered most vulnerable to the following activities: landfills and dumps; sewer collection systems; gas stations; dry cleaners; metal plating/finishing/fabricating shops; military installations; chemical/petroleum processing and storage facilities; and underground storage tanks.

A copy of the complete assessment is available at Liberty's Downey office and the SWRCB office in Glendale. You may request a summary of the assessment by contacting Mr. Frank Heldman of Liberty at 562-805-2015, or by contacting Ms. Lillian Luong, SWRCB sanitary engineer, at 818-551-2038.

Important Health Information

1,4 - Dioxane

In 2011, Liberty, along with other water utilities in the Central Basin aquifer, sampled all wells for 1,4-dioxane at the request of the SWRCB. While 1,4-dioxane is not a regulated chemical, SWRCB had set a Notification Level (NL) of 1 part per billion (ppb) in 2010. In 2020, Liberty found 1,4-dioxane in one active well in the Lynwood/Rancho Dominguez system at 2.5 ppb. SWRCB does not recommend Liberty remove this well from service until it exceeds 10 times the NL.

Little scientific data are available on the long-term effects of 1,4-dioxane on human health, although the USEPA has listed it as a probable human carcinogen. Besides this notice, the only action required was notification of the Lynwood City Council and the County Board of Supervisors. This was done on June 30, 2020.

Lead

While there have never been any problems with lead in our water system, the USEPA and the SWRCB require the following information to be presented in this report. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Liberty is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure are available from the Safe Drinking Water Hotline or at <http://www.epa.gov/lead>.

Drinking Water Fluoridation

Fluoride has been added to U.S. drinking water supplies since 1945. Of the 50 largest cities in the U.S., 43 fluoridate their drinking water. Liberty treats your water by adding fluoride to the naturally occurring level to help prevent dental caries in consumers. State regulations require the fluoride levels in the treated water to be maintained within a range of 0.6 mg/L to 1.2 mg/L with an optimum dose of 0.7 mg/L. Our monitoring showed that the fluoride levels in the treated water ranged from 0.58 mg/L to 0.95 mg/L with an average of 0.72 mg/L. Information about fluoridation, oral health, and current issues is available from https://www.waterboards.ca.gov/drinking_water/certific/drinkingwater/Fluoridation.html

Unregulated Contaminant Monitoring Regulation (UCMR)

The Safe Drinking Water Act requires the USEPA to identify unregulated contaminants for potential regulation. Every five years, the USEPA identifies a list of unregulated chemicals to be monitored by the nation's water utilities over a three-year period. The current monitoring cycle (UCMR-4) is from 2018 – 2020. Results from this monitoring are included in this report. Once the USEPA has compiled this occurrence data nationally, they are required to determine if there is a meaningful opportunity for increased health protection of drinking water through regulation of these contaminants.

Lynwood-Rancho Dominguez 2020 Annual Water Quality Report

Primary Standards - Health Based (units)	Primary MCL	PHG (MCLG)	Range of Detection for MWD	Average Level for MWD	Range of Detection for LU Sources	Average Level for LU Sources	Most Recent Sampling Date ^(b)	Typical Source of Constituent
Turbidity^(a)								
Highest single measurement of the treated surface water (NTU)	TT = 1.0	n/a	0.04	n/a	n/a	n/a	2020	Soil runoff
Lowest percent of all monthly readings less than 0.3 NTU (%)	TT = 95	n/a	100	n/a	n/a	n/a	2020	Soil runoff
Inorganic Constituents								
Aluminum (µg/L)	1000	600	ND - 260	137	ND	ND	2020	Erosion of natural deposits; residue from some surface water treatment processes
Arsenic (µg/L)	10	0.004	ND	ND	2.3-3.2	2.71	2020	Erosion of natural deposits; runoff from orchards, glass and electronics production wastes
Barium (mg/L)	1	2	0.11	0.11	0.14	0.14	2019	Discharges of oil drilling wastes and from metal refineries; erosion of natural deposits
Fluoride (mg/L) [Naturally occurring]	2.0	1	0.5 - 0.9	0.7	0.26-28	0.27	2020	Erosion of natural deposits; water additive that promotes strong teeth; discharge from fertilizer and aluminum factories
Nitrate [as N] (mg/L)	10	10	ND	ND	ND - 0.7	ND	2020	Runoff and leaching from fertilizer use; leaching from septic tanks and sewage; erosion of natural deposits
Radioactive Constituents								
Gross Alpha Activity (pCi/L)	15 ^(a)	(0)	ND - 3	ND	3.1 - 3.2	3.2	2017	Erosion of natural deposits
Gross Beta Activity (pCi/L)	50	(0)	ND - 7	ND	n/a	n/a	2020	Decay of natural and man-made deposits
Uranium (pCi/L)	20	0.43	1 - 3	2	ND - 2.5	ND	2017	Erosion of natural deposits
Secondary Standards - Aesthetic (units)	Secondary MCL	PHG (MCLG)	Range of Detection for MWD	Average Level for MWD	Range of Detection for LU Sources	Average Level for LU Sources	Most Recent Sampling Date	Typical Source of Constituent
Aluminum (µg/L)	200	n/a	ND - 260	137	ND	ND	2020	Erosion of natural deposits; residue from some surface water treatment processes
Chloride (mg/L)	500	n/a	ND - 3	ND	29	29	2019	Runoff/leaching from natural deposits; seawater influence
Manganese (µg/L)	50	n/a	ND	ND	53-66	57	2019	Leaching from natural deposits
Odor—Threshold (units)	3	n/a	2	2	1	1	2019	Naturally-occurring organic materials
Specific Conductance (µS/cm)	1600	n/a	964 - 975	970	540	540	2019	Substances that form ions when in water; seawater influence
Sulfate (mg/L)	500	n/a	215 - 218	216	78	78	2019	Runoff/leaching from natural deposits; industrial wastes
Turbidity (units)	5	n/a	ND	ND	ND-0.4	0.05	2020	Soil runoff
Total Dissolved Solids (mg/L)	1000	n/a	582 - 603	592	310	310	2019	Runoff/leaching from natural deposits
Other Parameters (units)	Notification Level	PHG (MCLG)	Range of Detection for MWD	Average Level for MWD	Range of Detection for LU Sources	Average Level for LU Sources	Most Recent Sampling Date	Typical Source of Constituent
Aggressive Index [c]	n/a	n/a	12.3 - 12.4	12.4	12.5	12.5	2019	The sum of polyvalent cations present in the water, generally magnesium and calcium; the cations are usually naturally occurring
Alkalinity as CaCO3(mg/L)	n/a	n/a	117 - 120	118	170	170	2019	
Calcium (mg/L)	n/a	n/a	65 - 67	66	60	60	2019	
Hardness [as CaCO3] (mg/L) ^(d)	n/a	n/a	261 - 269	265	175	175	2019	
Magnesium (mg/L)	n/a	n/a			6.9	6.9	2019	
pH (pH units)	n/a	n/a	8.1	8.1	8.1	8.1	2019	
Potassium (mg/L)	n/a	n/a	4.5 - 4.7	4.6	2.9	2.9	2019	
Sodium (mg/L) ^(e)	n/a	n/a	93 - 98	96	45	45	2019	Refers to the salt present in the water and is generally naturally occurring

KEY TO ABBREVIATIONS AND FOOTNOTES

mg/L or ppm = milligrams per liter or parts per million

µg/L or ppb = micrograms per liter or parts per billion

ng/L or ppt = nanograms per liter or parts per trillion

pCi/L = picoCuries per liter

NA or N/A = Not applicable or Not required

ND = Not detected

TT = Treatment Technique

NL = Notification Level

NTU = Nephelometric Turbidity Units. This is a measure of suspended material in the water

(a) = Turbidity is a measure of the cloudiness of the water and is a good indicator of water quality and filtration performance

(b) = The state allows us to monitor for some parameters less than once per year because the concentrations of these parameters in groundwater sources do not change frequently. Some of the data, though representative, are more than one year old.

[c] = An aggressive Index of 11 or greater indicates the water is non-aggressive (non-corrosive)

(d) = Hardness is the sum of polyvalent cations present in the water, generally magnesium and calcium. The cations are usually naturally occurring.

[e] = Sodium refers to the salt present in the water and is generally naturally occurring.

(f) = Manganese monitored at the system interconnection not at the source

(g) = The TTHM average is the highest of the Locational Annual Running Average (LRAA) for the year

(h) = The HAA5 average is the highest of the Locational Annual Running Average (LRAA) for the year

DEFINITIONS

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Primary Drinking Water Standard (PDWS): MCLs, MRDLs and treatment techniques (TTs) for contaminants that affect health, along with their monitoring and reporting requirements.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.
